## Company Information

WorldCLASS Manufacturing Systems Ltd. has been formed specifically to address the needs of high technology information systems applied to Real-World manufacturing requirements.

It is associated with Custom Electronics and has been organised to merge their well-proven software, hardware and system capabilities, with the services of leading manufacturing systems consultants within a flexible structure designed to give its clients the highest level of service in consultancy, application development, system integration and support.

The company is specifically aimed at the global market of the millennium, and employs the facilities of mobile open office technologies, to link its network of consultants and engineers from the company's head-quarters in the UK.

The technical objectives of the company are the application and development of world-class tools in the categories of shop-floor data collection, capacity planning and scheduling, with these packages being available on multiple hardware platforms and backed up with comprehensive maintenance and support.

The benefits provided to the client are principally through the optimal use of the client company resources, (which are the key to their competitive advantage) with highlights on improved productivity, faster time to market and more responsive customer service.

The tools are designed to help solve problems such as configuration, production scheduling, resource allocation and logistics planning. The company has evolved a product family capable of addressing problems of any size, in a flexible fashion, allowing applications to evolve smoothly.

WorldCLASS scheduling products are being used by several multinational business partners in the provision of systems integrating to Enterprise Resource Planning (ERP) systems, superseding MRPII.

WorldCLASS software, hardware and system engineering resources are backed up by Custom Electronics engineers, who have a proven track record of 20 years involvement in the design of high technology, shopfloor, process control, data-capture, computing and management information systems.
